PRODUCT OVERVIEW

The Vizimax Standalone Merging Unit (AMU) converts analog AC current and voltage measurements into high accuracy digital messages or Sampled Values (SV) published over a substation process bus in compliance with the IEC 61850-9-2LE and IEC 61869-9 standards.

The unit provides the capability of transmitting Sampled Values (SV) according to the Protection portion of the standard or based on the Measurement portion of the standard.

The Vizimax Standalone Merging Unit can publish two IEC data streams **simultaneously**, no matter the format (example: 80 s/cycle according to IEC 61850-9-2LE + 14400 s/sec according to IEC 61869-9). Data can be directly used by bay controllers and/or protection relays that support these protocols.

The Vizimax AMU's time synchronization can be achieved via external equipment (i.e IRIG-B/PPS), or via network link (i.e PTP1588, SNTP). An optional built-in GPS Receiver allows for the AMU's time synchronization even though no other external synchronization source is available. When synchronized through PTP1588 or when equipped with its GPS Receiver the Vizimax's AMU can be a precision time synchronization server to adjacent equipment.

The AMU features multiple Ethernet communication ports that support a configurable parallel redundancy protocol (PRP), as well as the local or remote access to the unit for its operation and configuration.

The AMU supports 61850-GOOSE publisher of digital inputs and signalization outputs.

The IEC 61850-GOOSE subscriber protocol with the XCBR model is supported with the MGC001000 option (+ 6 high current - high speed outputs) to control a 3-phase circuit breaker.

The AMU supports the Modbus TCP/RTU (slave) protocol thus allowing industrial equipment and controllers to leverage its data streams.

Vizimax also offers an **AMU-RTS version** (Standalone Merging Unit for Real-Time Simulation) suitable for hardware-in-the-loop **Real-Time Simulation** environment such as OPAL-RT's RT-LAB or Hypersim, or RTDS Technologies' RTDS.

With its outstanding performances in measuring, computing and reporting time stamped data, the Vizimax Standalone Merging Unit is a perfect solution for new digital substations or for the retrofit and digitalization of legacy equipment in existing substations.

OPERATING ENVIRONMENT

The Vizimax AMU combines the acquisition of AC current and voltage measurements from conventional transformers (CTs and PTs) and converts these signals into digital time-synchronized sampled values.

The Vizimax AMU can be installed in a substation control room or integrated in an outdoor equipment junction box.

In its operating environment, the AMU device is connected to several components or systems:

- The DC power supply
- The AC measurement input connections (from CTs and PTs)
- The time synchronization inputs
- The communication links (Ethernet links, Ethernet service port and serial port).
- The status and alarm signals (signalization outputs and digital inputs).
- 6x optional high current - high speed digital outputs (MGC001000) to control a circuit breaker (XCBR function).

FIGURE 1 AMU IN ITS OPERATING ENVIRONMENT

The VIZIMAX AMU has a capability of publishing the signalization output states and the digital IOs states using IEC 61850-GOOSE publisher protocol. This functionality allows fast data exchange with protection systems and automation platforms.

The MGC001000 option allows for controlling a 3-phase circuit breaker (independent poles) with the 6 power outputs by subscribing to GOOSE messaging.

TIME SYNCHRONIZATION

Vizimax AMU's time synchronization can be achieved by either:

- **An external device:**
 - IRIG-B un-modulated signal:
 - IRIG-B000/B004 C37.118
 - IRIG-B000/B004 IEEE1344
 - IRIG-B signal received through either:
 - fiber optic – ST connector
 - copper – BNC-TTL
- **A network link:**
 - IEC 61588 (IEEE 1588) PTP compliant master clock: Ethernet port 1 and 2 include specific hardware for a full PTP1588 compatibility (multiple profiles incl. IEC 61850-9-3).
 - SNTP Client – Server service enhanced with BNC-TTL or IR fiber PPS inputs
- **In Stand-alone:**
 - By using the optional built-in GPS receiver (Option MGC000100).

Any one of these approaches renders the required accuracy to transmit SVs (sampled Value) in conformance with the IEC 61869-9 and IEC 61850-9-2LE protocols.

TIME SYNCHRONIZATION SERVER MODE

Vizimax AMU has the capability of providing time synchronization source to other equipment:

- PTP1588 time synchronization server (master clock with leap second support): requires the optional built-in GPS receiver or a connection to another PTP1588 time synchronization source.
- NTP time synchronization server (UTC format support): requires the optional built-in GPS receiver or a connection to another time synchronization source providing UTC time data.
- High accuracy PPS output signal available to other devices via the BNC connector (when not used as an input).

COMMUNICATION LINKS

The AMU provides 3 Ethernet ports:

- Port 1 and 2 can be configured for 61850-9-2 / 61869-9 communications, GOOSE messaging as well as for time synchronization and secured access to a web interface and configuration tools:
 - Standard: Copper Ethernet connections (100BASE-T) with RJ-45 connectors
 - Option MGC010000: Replace 2xRJ45 by 2x Fiber-optic connections 100BASE-FX with ST connectors multimode (allowing 2km transmission)
 - Option MGC020000: Replace 2xRJ45 by 2x Fiber-optic connections 100BASE-LX with LC connectors Single mode (allowing 10km transmission)
 - Option MGC021000: Replace 2xRJ45 by 2x Fiber-optic connections 100BASE-FX with LC connectors multimode (allowing 2km transmission)
- Port 3 located on the AMU's back panel (or front panel in the 19" rack configuration) is used as a local service port or for remote maintenance (RJ-45 connector).

The AMU provides 2 serial ports:

- The RS232 port A.
- The RS485-RS232 configurable port B.

The AMU offers a user-friendly graphical web operating interface. Furthermore, the Vizimax Tool Suite for Microsoft Windows provides a rich environment for the remote configuration of the unit and data analysis.

DATA ACQUISITION RATES

The AMU publishes sampled values according to the multicast sampled values control block (MSVCB01 for protection portion of the standard) or (MSVCB02 for the measurement portion of the standard) as defined in the 9-2LE guide.

When targeting protection relays and bay controllers, sampling occurs 80 times per cycle (thus 4000 or 4800 times per second depending on nominal network frequency, i.e. 50 Hz or 60 Hz). When the measurement sampling is selected, the unit samples at a rate of 256 samples per cycle (12800 sample/s to 15360 sample/s) and transmits this information in blocks of 8 per the standard to minimize bandwidth usage.

The AMU also supports (MSVCB03 for protection portion of the standard) or (MSVCB04 for the measurement portion of the standard) as defined in the IEC 61869-9 standard. The advantage of this standard is to have a fixed number of sampled values per second whatever the network frequency.

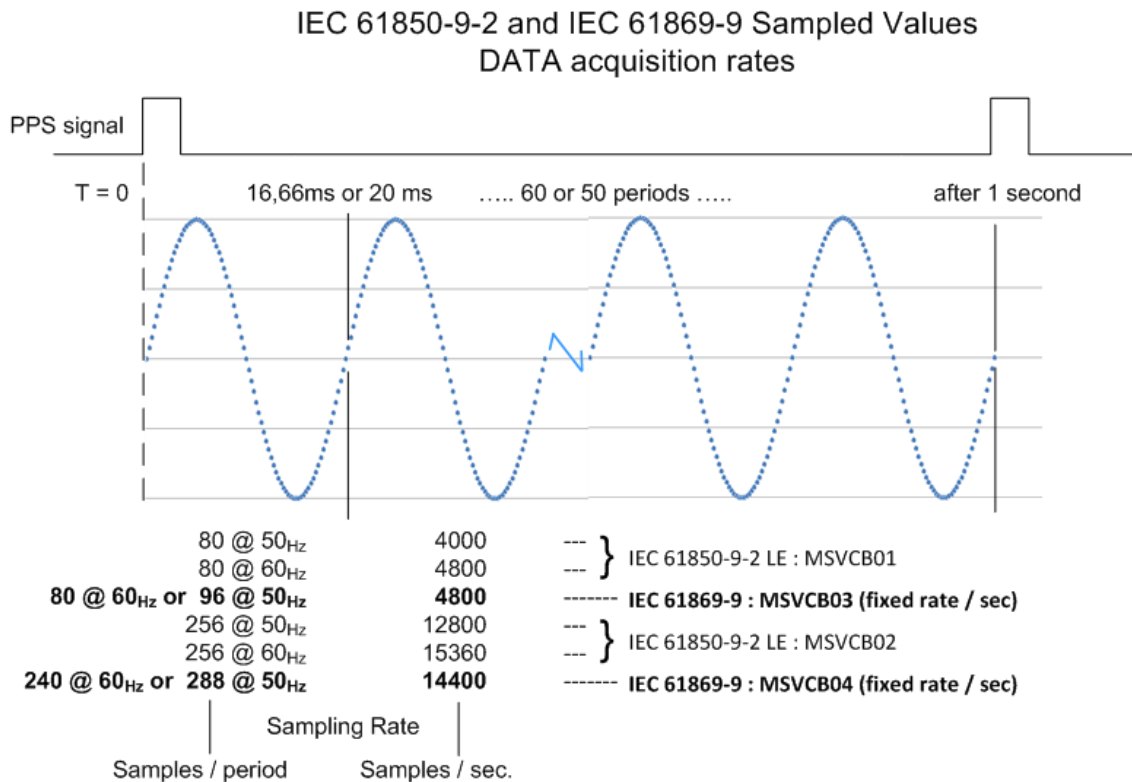

FIGURE 2 AMU DATA ACQUISITION RATES

Vizimax Standalone Merging Unit supports ALL these sampling rates and can publish two data streams simultaneously, no matter the format.

DATA REPORTING AND OPTIONAL CONTROL

Data published through IEC 61869-9 or IEC 61850-9-2LE and 61850-GOOSE formats are time stamped with accuracy better than 1ms and can be used for real time applications as well as for offline analysis.

Digital signal states can be reported over the Modbus protocol to other industrial equipment.

The secured Web interface displays an extensive set of information as described in Figure 3 below.

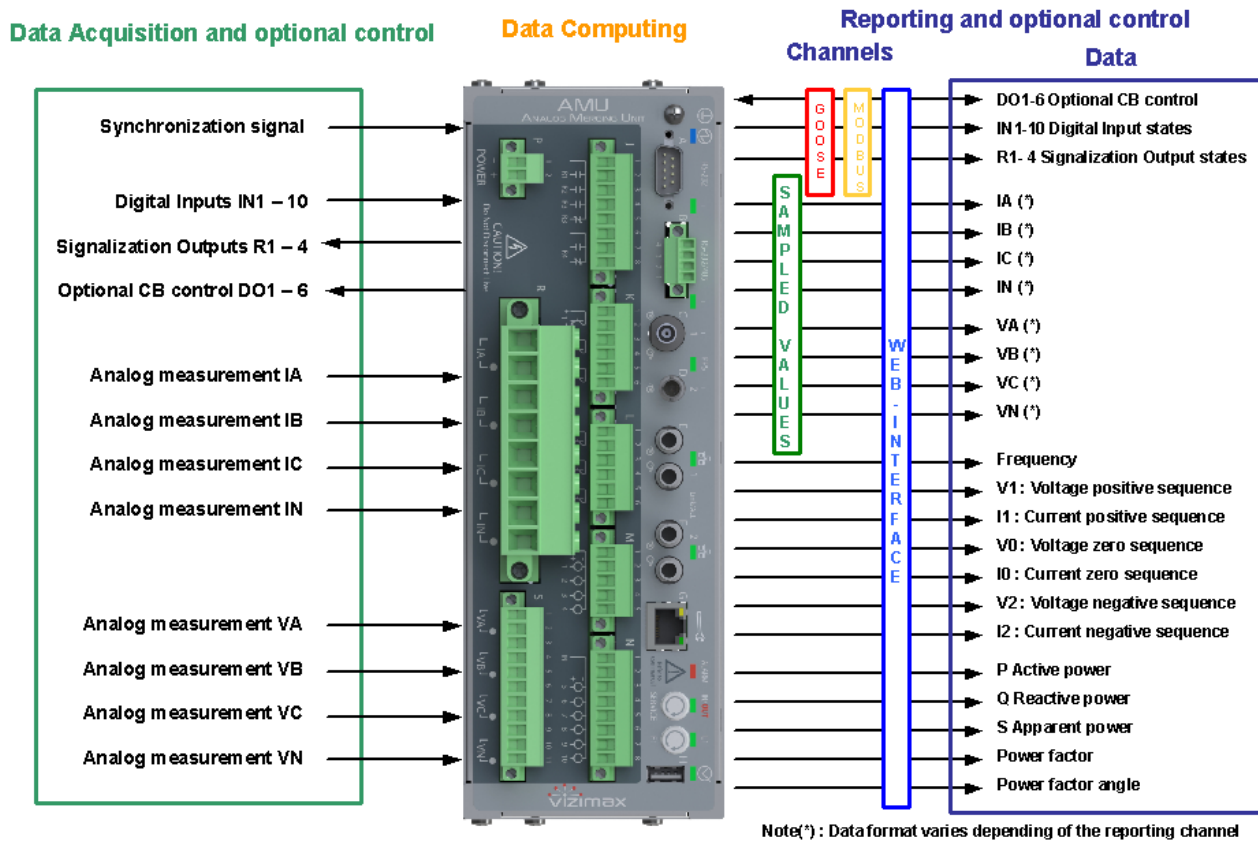

FIGURE 3 DATA ACQUISITION – REPORTING AND OPTIONAL CONTROL

These 6 outputs can also be controlled through Modbus protocol when not activating the XCBR control model.

Note 2: Starting firmware 1.5 and up, AMU unit supports the MMS server Ed.2 protocol.

ABOUT THE AMU-RTS (REAL TIME SIMULATION) MODEL

The **AMU-RTS** (Standalone Merging Unit for Real-Time Simulation) is a component of the AMU product family specially designed for hardware-in-the-loop **Real-Time Simulation** environment such as OPAL-RT's RT-LAB™ or Hypersim™, or RTDS Technologies' RTDS®

The AMU-RTS unit offers the same functionality as the standard AMU, but the AC measuring inputs (current and voltage inputs) are compatible with a low voltage signal (10Vrms) provided by real-time simulation hardware.

Therefore, real life AMU's applications can be fully simulated in a laboratory environment without needing expensive analog power amplifiers or high voltage discrete I/O interfaces.

The **AMU-RTS** unit is available with the following hardware configuration:

- Power Supply: 24Vdc
- AC input current measurement: 10Vrms input range.
- AC input voltage measurement: 10Vrms input range.
- Digital inputs: 10 inputs
- High current – high speed digital outputs: 6 floating outputs
- Signalization outputs: 4 electromechanical relay outputs

The mechanical mounting configuration, the time synchronization and the Ethernet communication ports are customer selectable at unit order. Please refer to the Smart coding document (MGU010000-SC) for more details on the available options.
